

Phase 7 Document 1 - Revision 1

House Win Rate & Adaptive Difficulty Amendment

This amendment replaces the fixed house win rate concept with an adaptive probability model.

Adaptive House Probability Model

The platform shall not hard-code a fixed 65 percent house win rate. Instead, the system shall operate within a target range of approximately 60 to 70 percent house victories, with 65 percent used as the operational target. Actual performance will be monitored continuously.

Dynamic Difficulty Adjustment

The platform continuously evaluates completion rates, challenge success rates and treasury exposure. If player success rates become too high, challenge difficulty may be increased. If player success rates become too low, challenge difficulty may be reduced.

House Fairness Principle

House advantage must come from challenge design, timer pressure and difficulty engineering rather than impossible conditions. Challenges must remain winnable by highly skilled players.

Monitoring Metrics

Track Actual House Win Percentage, Actual Player Win Percentage, Difficulty Distribution, Completion Times, Player Retention and Treasury Risk Exposure.

Acceptance Criteria

The challenge engine maintains long-term sustainability while ensuring house challenges remain fair, competitive and engaging.
