

Phase 8 Document 1 - Revision 1

Daily Skill Calibration & Player Baseline System Amendment

Purpose

Introduce a daily skill calibration system that continuously measures player capability and improves platform intelligence.

Daily Calibration Maze

Every player receives one daily calibration challenge generated specifically for measurement purposes.

No Financial Impact

Calibration challenges have no entry fees, rewards, losses or ranking consequences.

No Competitive Impact

Results do not affect league rankings, seasonal standings or reputation scores.

AI Calibration Purpose

Results are used to improve AI Solver accuracy, human performance models and difficulty calibration.

Behavioral Baseline

The platform builds a long-term behavioural profile for each player.

Account Sharing Detection

Major changes in gameplay style, reaction patterns or completion ability trigger investigation signals.

Bot Detection Support

Calibration results provide clean behavioural data for anti-bot systems.

Matchmaking Support

Player skill estimates become more accurate over time.

House Balancing Support

House challenge models gain better visibility into actual player capabilities.

Verification Support

Calibration history may be used during fraud investigations and verification reviews.

Performance Tracking

Track completion times, route efficiency, error rates and behavioural consistency.

Adaptive Intelligence Loop

Calibration data feeds replay intelligence, trust scores, AI solvers and challenge balancing engines.

Player Experience

Challenge should be short, optional and unobtrusive while providing valuable system intelligence.

Acceptance Criteria

The platform continuously improves player modelling accuracy without negatively impacting the user experience.
